4 Volatility Environment

The IWN ATM implied volatility averaged **29.5%** over the period, ranging from 24.1% to 34.8%. This level is consistent with the 21-day realised vol of 18.4% reported in the main strategy document, suggesting options are **fairly priced** relative to realised moves.

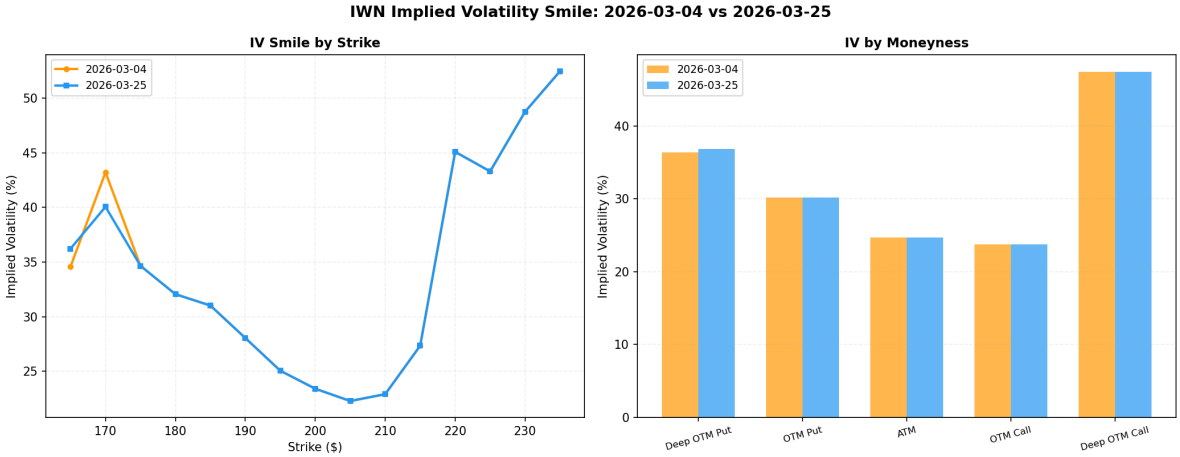

Figure 2: IWN implied volatility smile: early March vs late March 2026. Left panel shows IV by strike price; right panel shows IV grouped by moneyness bucket. The characteristic skew—higher IV for OTM puts—is typical of small-cap equity ETFs.

Key observations:

- BTC/USD traded in a $66,452–$74,554 range (+4.9% net) with 39% annualised vol
- Grayscale BTC share tracked spot with +5.9% return vs +4.9% for spot BTC/USD
- IWN IV remained stable, supporting continued use of the put hedging strategy at current pricing levels
- The maximum intra-period BTC/USD drawdown was -8.8%, highlighting the need for the correlated put hedge overlay
