+10%	\$5,063	7.8%	\$4,027	6.2%	\$1.74	0.7%	\$0.91	0.3%

9. Key Observations

1. BTC realized vol at 89% is at the 90th percentile of the last 6 months. ATM 30-day calls cost 13.7% of spot (\$8,888), nearly 3x the 6-month-ago level of 4.8%.
2. IWM realized vol at 25% is at the 98th percentile. ATM 30-day calls cost 4.8% of spot (\$12.77).
3. BTC/IWM vol ratio is 3.6x vs 2.8x mean. BTC carries a wider-than-normal vol premium, meaning BTC options are relatively expensive compared to equity options.
4. BTC options pricing implication: With vol at cycle highs, selling premium via covered calls or collars captures rich volatility. Buying protective puts is expensive but pays well during further drawdowns.
5. IWM options pricing implication: Vol elevated but within historical norms for risk-off periods. Directional calls are reasonably priced for a recovery bet; puts offer decent protection value.
